Manda Hararo 2026 — dike-frame decomposition

four LOS inputs (top row; positive toward the satellite, decay-normalized to 18 July)

free solve rotated to strike 153.0° · U⊥ positive toward 63.0° (ENE) · U∥ positive toward 333.0° (NNW, near-north) · up positive

Top row: the LOS inputs of the solve. The components are an exact rotation of the free E–N–U solve; σ includes the east–north cross-covariance. U∥ is nearly north–south, which near-polar SAR observes weakly; U∥ cells with formal σ > 5 cm are masked. No smoothing; gray = no solution (three-geometry cells in the closure panel). Red/dashed lines show the mapped dike and east-ridge context, not a solve constraint.
